English Book of the Dead: Volume (1)

Oxidative stress, caused by imbalance between the production of oxygen free radicals and the antioxidant capacity of cells, induces cell damage and abnormal production of adipocytokines, which directly leads to a series of metabolic abnormalities, including obesity-related insulin resistance, hypertension, abnormal blood lipids, and fatty degeneration of the liver 1213The ER is one of the most important intracellular signal transduction organelles Mitochondrial dysfunction has also been shown to be associated with the development of obesity and insulin resistance 10The Sirtuin family has become known

as a key regulator of the nutrient-sensitive metabolic regulatory pathway Obesity reduces SIRT1 activity in liver and adipose tissue 29Coenzyme Q10 CoQ 10 is a fat-soluble micronutrient synthesized in nearly all human cells and plays a role in electron transport in the mitochondrial respiratory chain 32CoQ 10 content in organs is gradually decreased with age and this decline is closely associated with the occurrence and development of various diseases Therefore, intake of exogenous CoQ 10 could help prevent the occurrence and progression of age-related diseases such as cardiovascular disease, metabolic syndrome, diabetes mellitus, cardiac dysfunction, and neurodegenerative diseases 353637CoQ 10 is enzymatically maintained in its reduced form CoQ 10 H 2 and also acts as a fat-soluble antioxidant to potently protect lipid membranes and lipoproteins from oxidative damage and to prevent DNA damage 3940In addition, other studies have shown that CoQ 10 H 2 content in adipose tissue gradually decreased with the development of obesity in both mice and humans, and that CoQ 10 H 2 synthesis-related enzymes were upregulated as a compensatory measure CoQ 10 H 2 also inhibits adipocyte differentiation and cholesterol synthesis 44but the mechanism remains unclear.
